# Waters of LIFE Advisor Training

## Module 3B: Intro to Catchment Science II -SPR Model

May 2025

# INTODUCING THE SOURCE-PATHWAY-RECEPTOR (SPR) MODEL

## How do pollutants actually reach a water body?

**SOURCE**

or pressure

**PATHWAY**

over land flow, through  
surface waterbodies, or  
groundwater.

**RECEPTOR**

Each part required for there to be an impact

## What is a catchment?

An area of land where all rainfall collects and drains to a single point.

## What is a catchment?

An area of land where all rainfall collects and drains to a single point.

## What is a catchment?

An area of land where all rainfall collects and drains to a single point.

You have to  
picture  
catchments in  
3 dimensions

Pathways:

- 1) Surface water
- 2) Ground water

Credit: The Groundwater Project

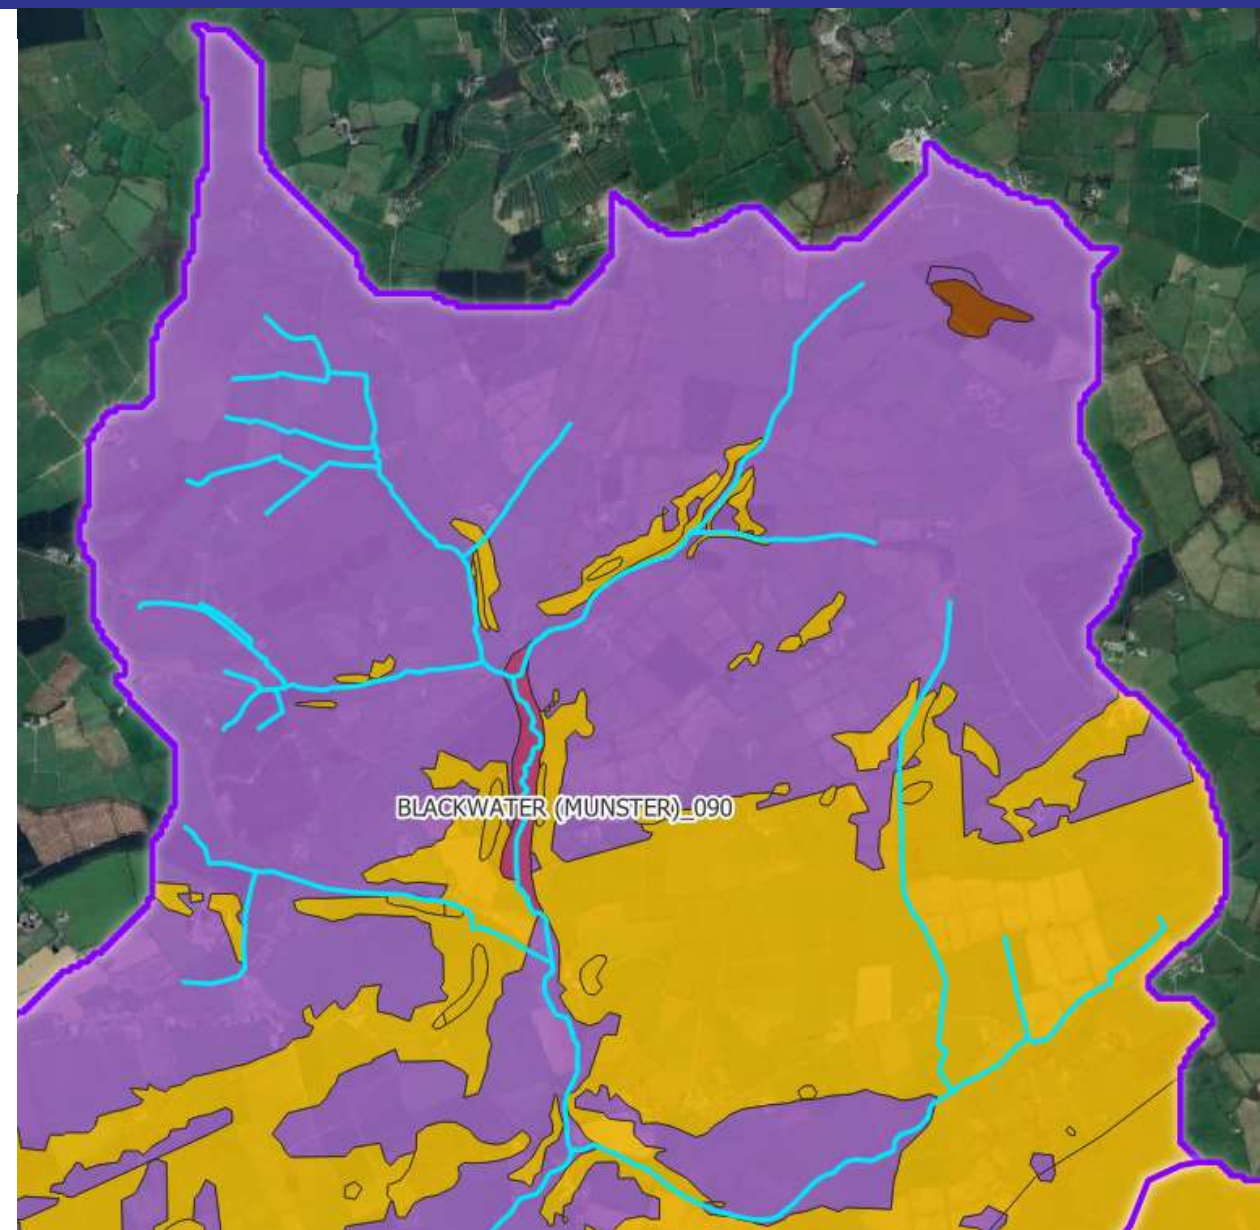

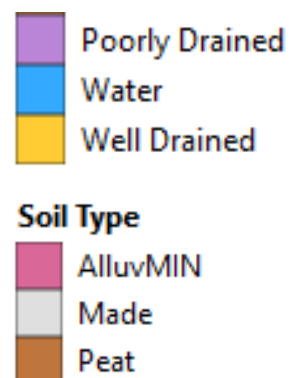

## Flow pathway determination

### 1. Underlying soil types

How porous is the soil?

### 2. Topography

Natural slopes in the landscape as well as features such intercepting streams and ditches

## Flow pathway determination

### 1. Underlying soil types

How porous is the soil?

### 2. Topography

Natural slopes in the landscape as well as features such intercepting streams and ditches

The bigger the grain size, the faster water can flow through subsoil

## Aquifer Interface

Will have  
varying  
levels of  
speed  
and  
direction

## Groundwater vulnerability

Can water and contaminants move in subsurface materials (soil and subsoil) and get down to groundwater easily?

### GSI Groundwater Vulnerability

## Path of least resistance

Once water cannot infiltrate soils, it will follow path of least resistance at the surface level

- Downhill following topography

## Types of surface runoff

Note: Enlarged soil particles are not drawn to scale.

Once water cannot infiltrate soils, it will follow path of least resistance at the surface level

- Downhill following topography

## Overland Flow Pathways

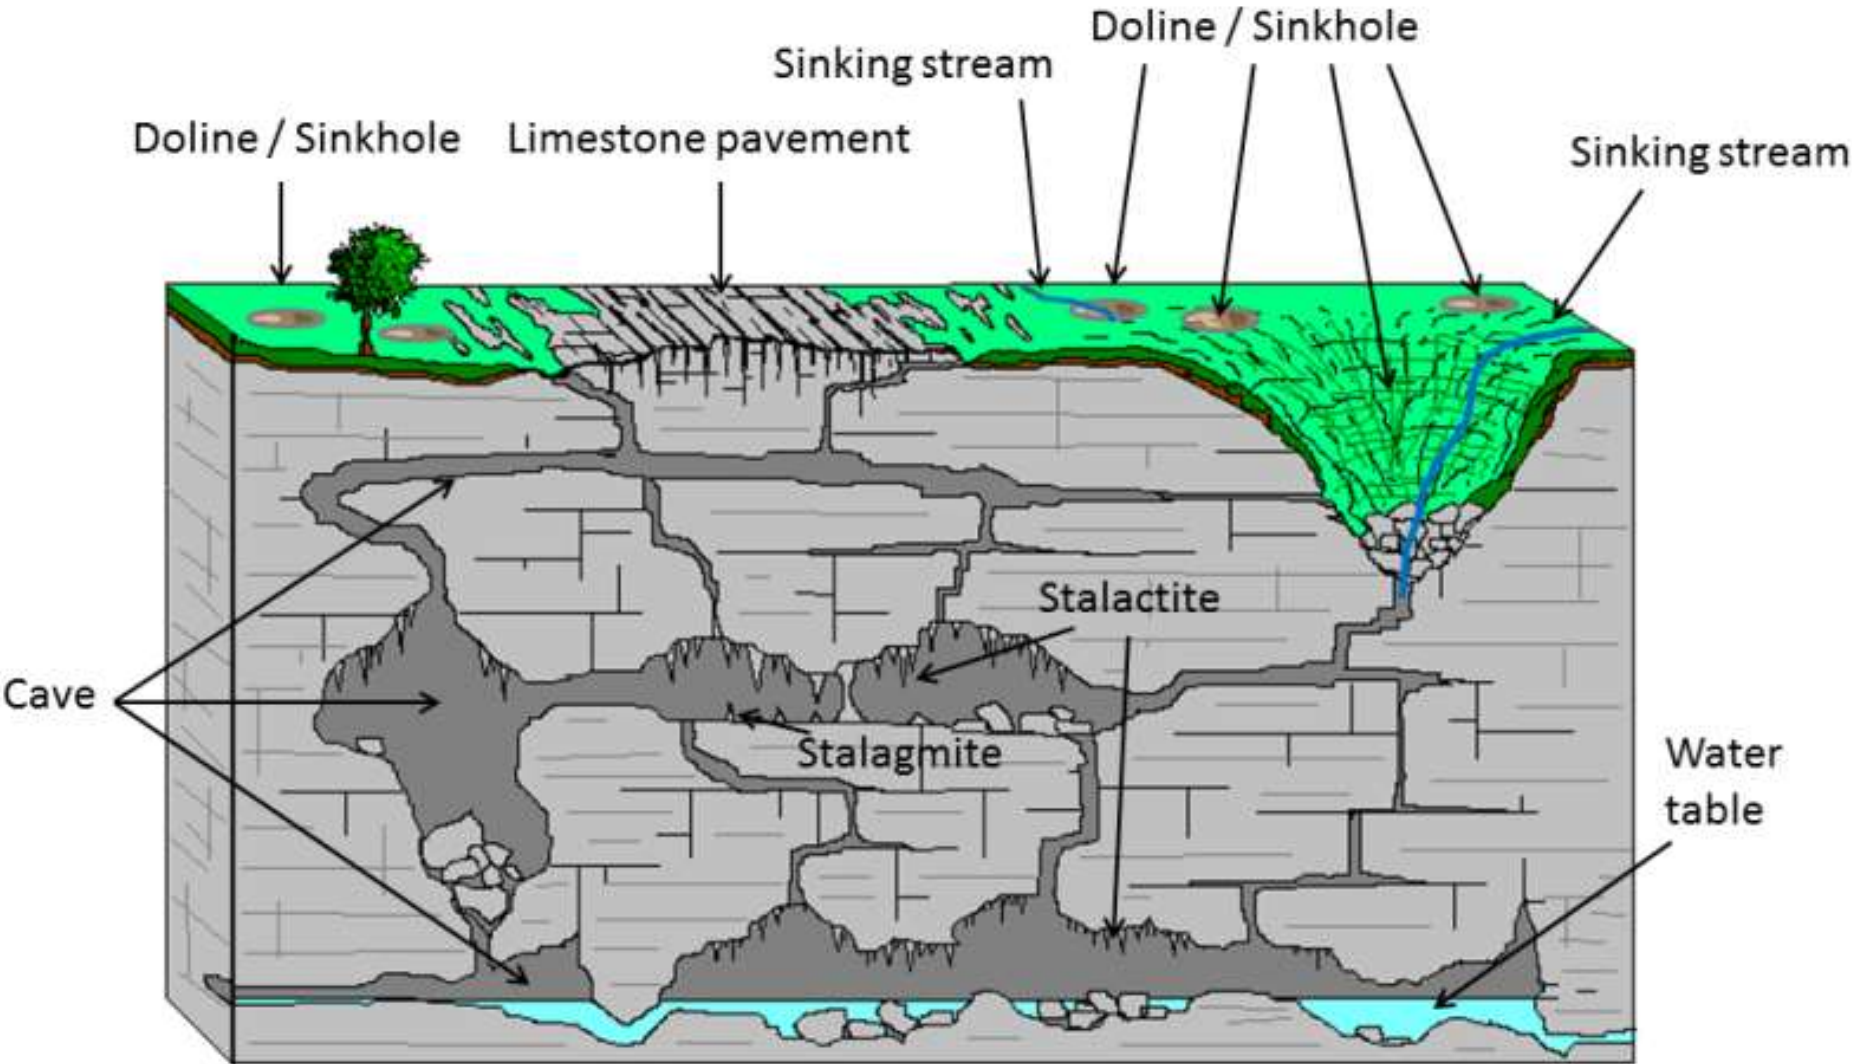

Credit: Aveland trees

Credit: GSI

Are called sink holes, dolines,  
sluggers etc.

Credit: GSI

## Pollution Impact Potential

Show the highest risk areas in the landscape for losses of N and P to water.

Derived from stocking rate and information on soil type and underlying hydrogeology

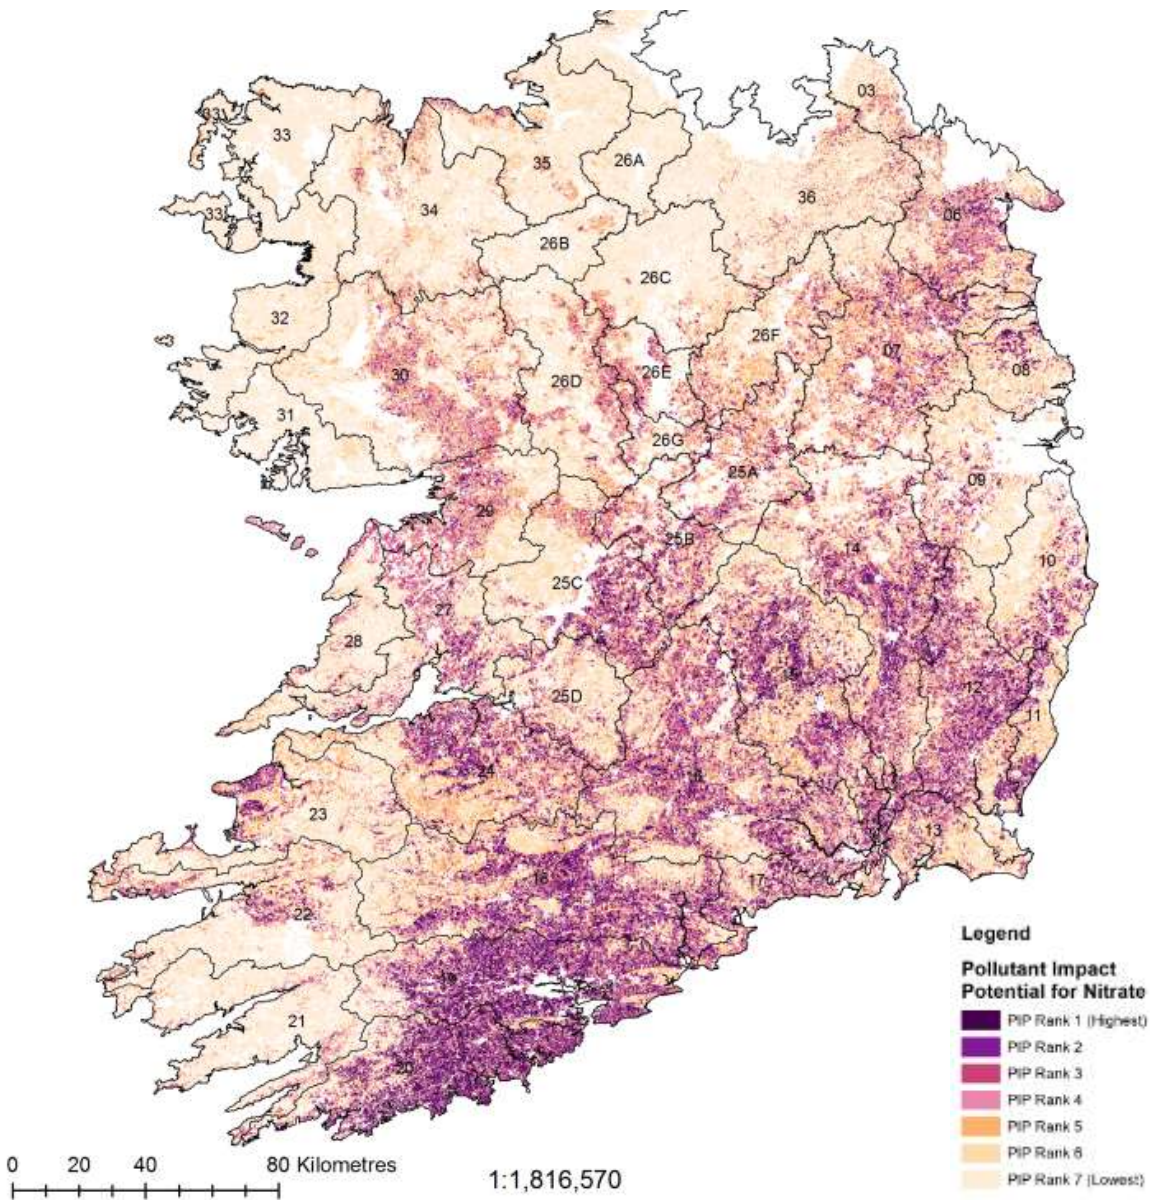

# Pollution Impact Potential Nitrate

Show the highest risk areas in the landscape for losses of N and P to water.

Derived from stocking rate and information on soil type and underlying hydrogeology

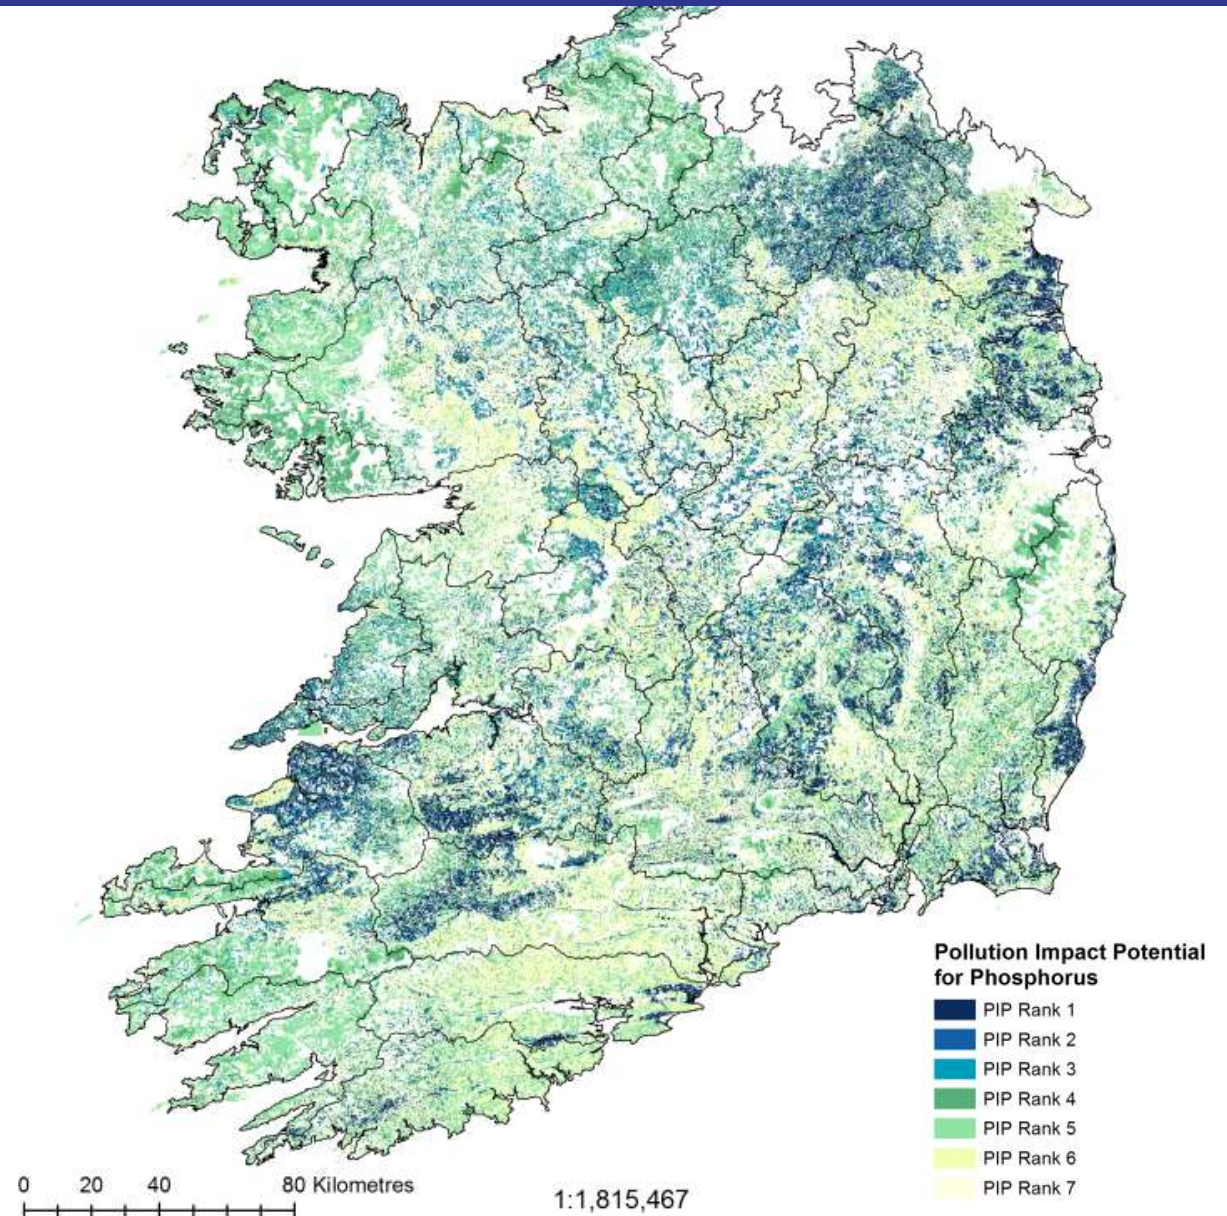

## Pollution Impact Potential Phosphorous

Show the highest risk areas in the landscape for losses of N and P to water.

Derived from stocking rate and information on soil type and underlying hydrogeology

# PIP Map Ranking

Most susceptible to loss

Least susceptible to loss

## Nitrogen:

 PIP Rank 1

 PIP Rank 2

 PIP Rank 3

 PIP Rank 4

 PIP Rank 5

 PIP Rank 6

 PIP Rank 7

## Phosphorous:

 PIP Rank 1

 PIP Rank 2

 PIP Rank 3

 PIP Rank 4

 PIP Rank 5

 PIP Rank 6

 PIP Rank 7

## Soil and Geology

Nutrients are absorbed and used in soil, less risk if contained.

Deeper soils are also less risky.

NITRATE	PHOSPHATE
More soluble in water	Sticks more readily to soil particles
Moves quickly through free draining soil	Cannot filter through poorly draining soil – stays in surface water

# Freely Draining Soil

VS

# Poorly Draining Soil

## PIP-P Flow Pathways

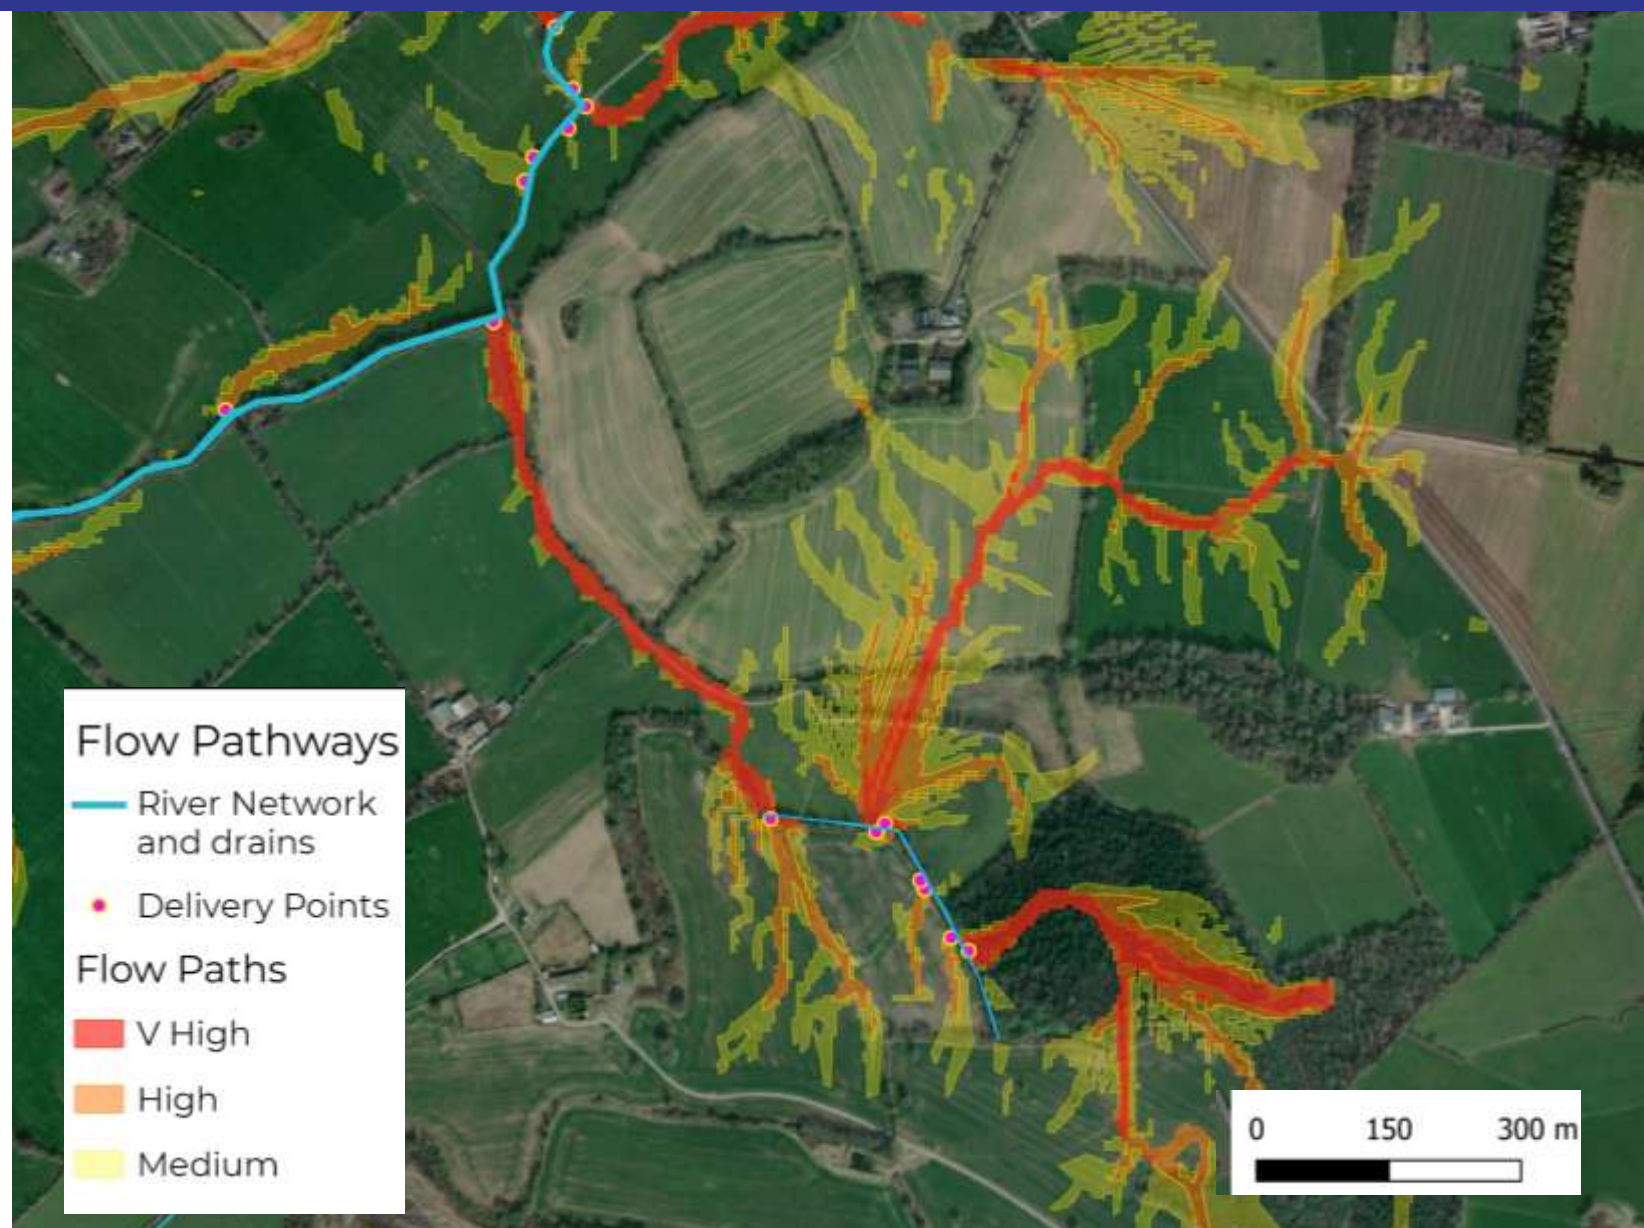

## PIP-P Flow Pathways

A model based off  
elevation maps

Only generated for  
poorly drained soils

### PIP Maps: A caveat.

- PIP maps are a model.
- Models are always wrong
- It's just a matter of how wrong!
- Use at a farm level, not field level, only as a introductory guide
- E.g.
  - Stocking rate is averaged across farm
  - Flow pathways do not consider hedges, ditches etc.

### Remember:.

- All three of source-pathway-receptor are needed for impact
- Catchments drain to a point, are three dimensional with surface and groundwater pathways.
- Various factors determine which pathway water will take
- PiP Maps help to determine if a particular farm is susceptible to P or N losses and where they might drain to
